

# G\_Series

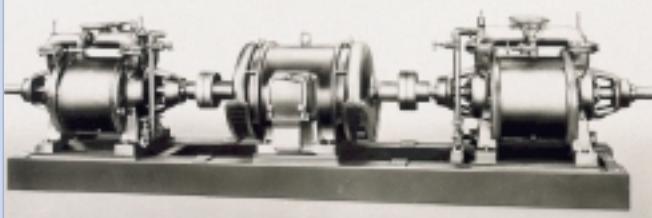

Gas Ring Blowers  
US Edition

## History

In May 2002 the Nash Engineering Company, USA, and elmo vacuum technology GmbH, Germany, formerly a Siemens subsidiary, merged to create a global leader in vacuum technology.

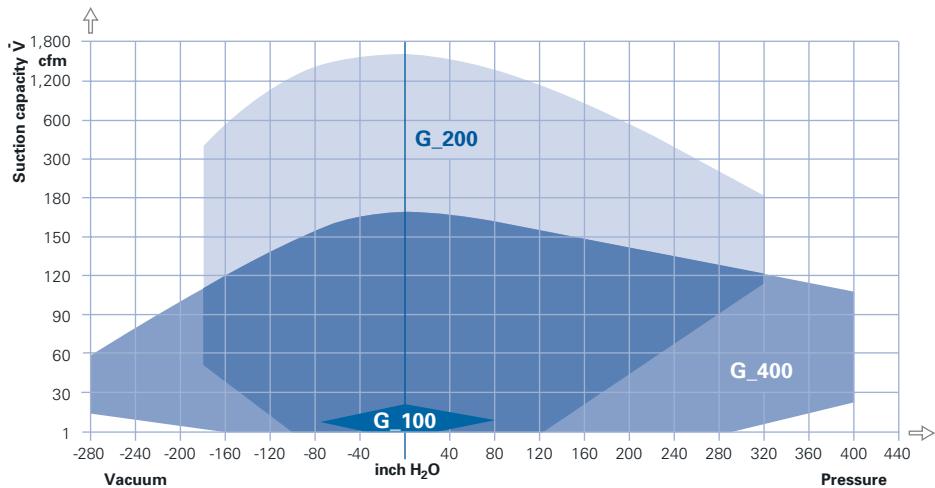

Headquartered in Connecticut, the company has manufacturing sites in the US, Brazil, Germany and China. A global network of sales and service centers makes sure that nash\_elmo is nearby when our customers need us.

**Let's do it. Together.**

# G\_Series Gas ring blowers and compressors

Some technologies are so good that it's hard to improve them. Gas ring blowers from nash\_elmo are such an example. They've proven their reliability in service for many decades, performing flawlessly day in and day out with virtually no down time. Existing noise levels have been lower than that of most other vacuum pumps and compressors.

G\_Series pumps and compressors are used for conveying gases and gas-air mixtures.

Main features:

- Low noise level
- Low Maintenance
- Reliable and built-to-last
- Robust yet light-weight
- Can be installed in any axial orientation
- Wide performance range
- For use worldwide (UL/CSA/IEC/EN approval)
- 50/60 Hz voltage range motors
- ATEX 94/9 EG

# G\_Series Gas ring blowers and compressors

G\_100

Driven via an electronically commutated, permanent-field DC motor.  
Infinitely variable over the entire power range.

G\_200

Single-stage version.

G\_200

Two-stage, for tougher requirements.

G\_200e

With integrated frequency converter for high volume flows and/or automatic modification to changing loads.

G\_400

Single-stage, for high pressure ranges.

G\_400

Multi-stage, reliability for high differential pressures

G\_400e

With integrated frequency converter.

G\_200e and G\_400e also available with external frequency converter

## Applications

- Pneumatic conveying systems
- Lifting and holding of parts by vacuum
- Packaging machines
- Aeration of sewage-treatment plants
- Filling of bags/bottles/hoppers
- Soil remediation
- Thermoforming
- Sorting/enveloping of letters
- Food-processing
- Laser printers
- Dental suction equipment
- Paper processing
- Printers/copiers
- Textile machines
- Aeration of fish ponds
- Gas analysis
- Swimming-pool equipment/whirlpools

The G\_Series vacuum pumps and compressors are available in a wide selection for performance ranges up to 1,770 cfm and differential pressures of up to 400 inch H<sub>2</sub>O. They cover the most varied requirements flexibly and powerfully. If frequency converters are used, any operating point can be precisely selected, maintained and controlled. These converters can be integrated into the machine but are also available as stand-alone models.

## Ex stock for use world-wide

The G\_Series pumps and compressors feature voltage range motors for 50 and 60 Hz in protection class IP 55 (insulation class F) and are UL 507 and CSA 22.2, No. 113 approved. This makes them the ideal solution for world-wide use: they can be used without modifications or tests in Europe, Asia and America. They are mostly available ex stock.

## Large range of accessories

nash\_elmo offers a large range of accessories for our G\_series that are ideally suited for these machines.

A special sound protection hood was designed for noise sensitive environments such as schools, living quarters, hospitals and production facilities. They can be installed outside, are maintenance-free and easy to transport.

An additional rigid silencer is now available for the G\_200 that will reduce the noise level even further.

## G\_Series – operating principle

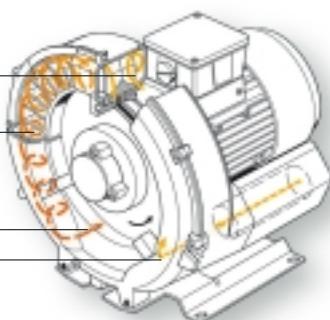

The impellers in the G\_Series machines are mounted directly on the motor shaft for non-contact compression entirely without friction. Maximum operational reliability, even at high differential pressures, is ensured by the arrangement of the bearings outside the compression chamber.

The gas is taken in through the inlet **1**. As it enters the side channel **2**, the rotating impeller **3** imparts velocity to the gas in the direction of rotation.

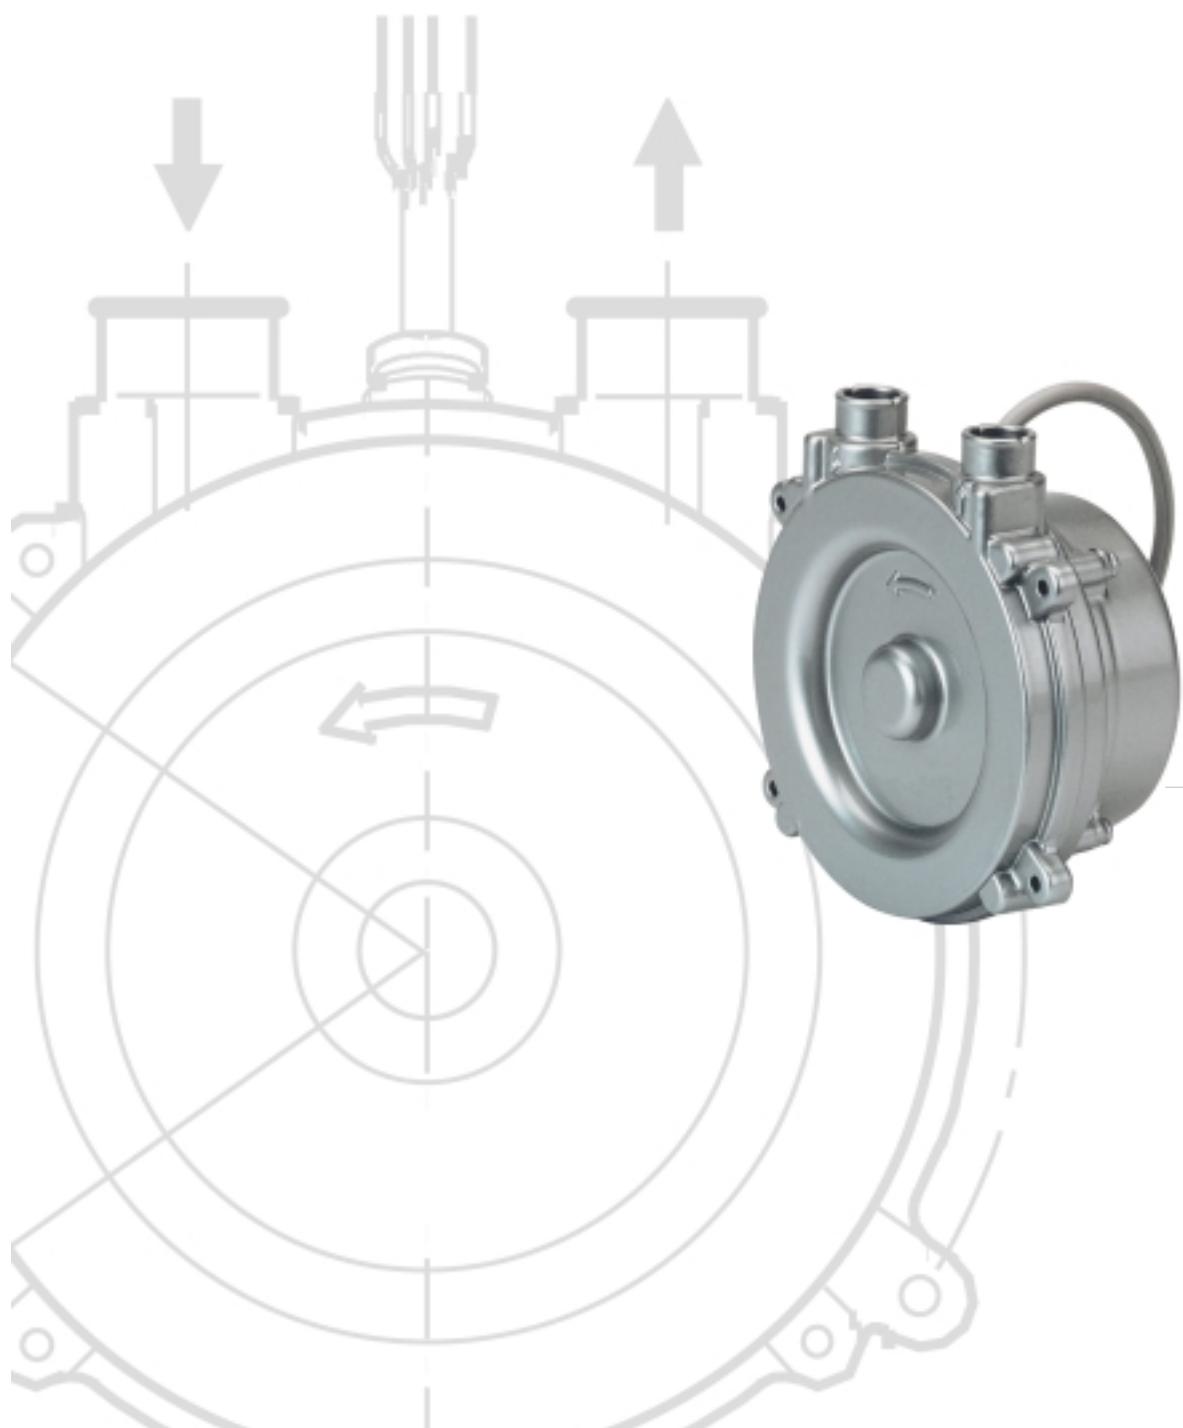

Centrifugal force in the impeller blades accelerates the gas outward and the pressure increases. Every rotation adds kinetic energy, resulting in further increase of pressure along the side channel.

The side channel narrows at the rotor, sweeping the gas off the impeller blades and discharging it through the outlet silencer **4** where it exits the pump.

- 2** side channel
- 3** impeller
- 4** outlet
- 1** inlet

**G\_100**

# G\_100

## The smallest gas ring blower on the market

With a height and width of approx. 5 inches and a depth of approx. 2.4 inches, the G\_100 blowers have the size of a CD and are the smallest gas ring vacuum blowers available on the market. Furthermore, the adjustable volume flow of the machines ensures that only the exact performance required is actually being supplied – not more.

These blowers are employed primarily in fine mechanical and medical technology applications. With their robust and built-to-last design, they are also used in other industries such as mechanical engineering.

The G\_100 is driven via an electronically commuted DC motor. This guarantees a high level of efficiency and maintenance-free operation for more than 20,000 operating hours. The operating electronics are a standard feature of the machines which allow infinitely variable control of speed and output of the blower.

## Classics with innovative technology

With their high inlet volume flow (up to 1,470 cfm) and a differential pressure of up to 313 inch H<sub>2</sub>O, our low noise G-series allrounders have earned their reputation and convinced thousands of customers all over the world.

They are reliable, low-maintenance and durable and are the first choice for many applications in mechanical engineering.

When used with a frequency converter the performance of the G\_200 pumps and compressors can be increased considerably.

The G\_200 machines are UL/CSA approved and can be used without further testing all over the world.

Available at short notice or ex stock and also as ATEX certified models, the G\_200 family is a classic that has proven its innovative quality.

# G\_Series G\_200e with frequency converter

The G\_200 pumps and compressors with integrated frequency converter (FC) are supplied with a standard speed of 5,000 min<sup>-1</sup>. A reduction in the speed and thus adaptation to the required duty point is possible

1. manually: by adjusting the setting at the potentiometer
2. automatically: by specifying the target value via the analogue input (0 ... 10 V, 0 .. 20 mA)
3. automatically: via the digital input

The range meets the EMC guidelines because of the radio interference suppression filter (class A) that is installed as standard.

#### Standard protection features:

- Over-voltage protection
- Short-circuit protection
- Overheating protection of converter
- PTC thermistor for integrated converter, optional for external converter

The performance curves are valid for pumping air at 60 °F (15 °C) at the inlet flanges with an air pressure of 29.9 in Hg abs. (1,013 mbar) and a tolerance of ±10%. The total pressure differences are valid up to an intake and ambient temperature of 77 °F (25 °C).

# Notes

**G\_400**

G\_400e with integrated or external  
frequency converter

G\_400 single and multi-stage

**Unsurpassed at highest differential pressure**

Our revolutionary G\_400 blowers can create pressure differences of up to 400 inch H<sub>2</sub>O – more than any other gas ring pump! So far, the systems used to reach these differential pressure ranges were much louder and larger – or subject to wear. Now the advantages of wear-free operation coupled with a low noise level can also be used in the most demanding applications.

The G\_400 vacuum pumps and compressors can work up to 20,000 hours without maintenance down time.

These specialist machines have proven their reliability under the harshest of conditions. Their noise level was already impressively low, but our engineers and designers were able to make them even more quiet.

# G\_Series G\_400e with frequency converter

The G\_400 pumps and compressors with integrated frequency converter (FC) are supplied with a standard speed of 5,000 min<sup>-1</sup>. A reduction in the speed and thus adaptation to the required duty point is possible

1. manually: by adjusting the setting at the potentiometer
2. automatically: by specifying the target value via the analogue input (0 ... 10 V, 0 .. 20 mA)
3. automatically: via the digital input

The range meets the EMC guidelines because of the radio interference suppression filter (class A) that is installed as standard.

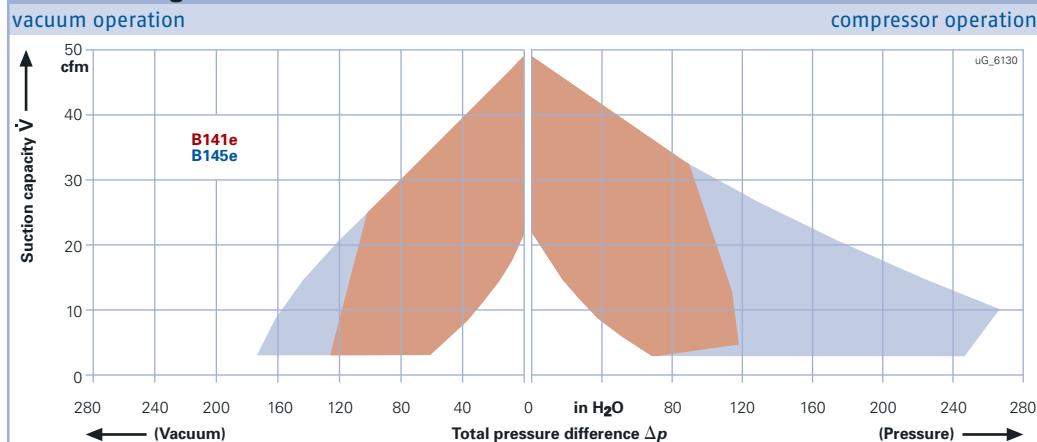

#### Standard protection features:

- Over-voltage protection
- Short-circuit protection
- Overheating protection of converter
- PTC thermistor for integrated converter, optional for external converter

# G\_Series Application examples

## Air cushion generation for paper processing machines

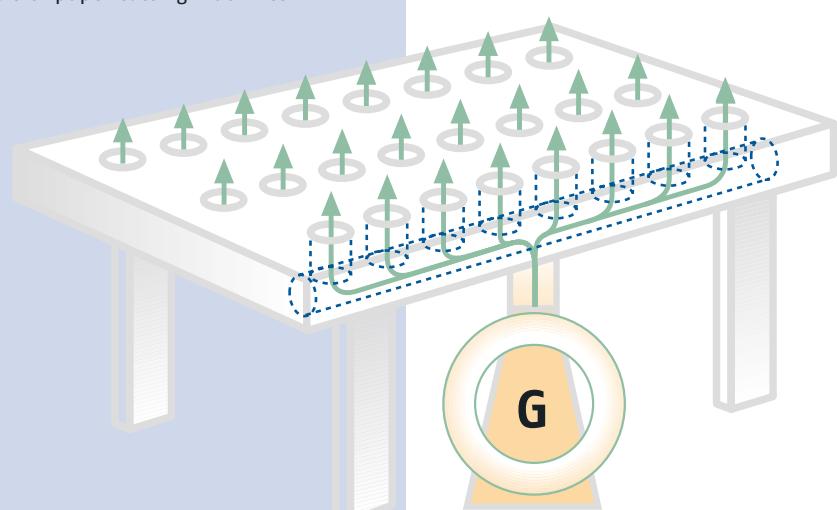

Several little blast pipes which are normally closed by ball valves are located in the table plate. When the balls are pressed down by the weight of a paper staple the valve is opened. Floating on an air cushion the paper now can be easily shifted and positioned.

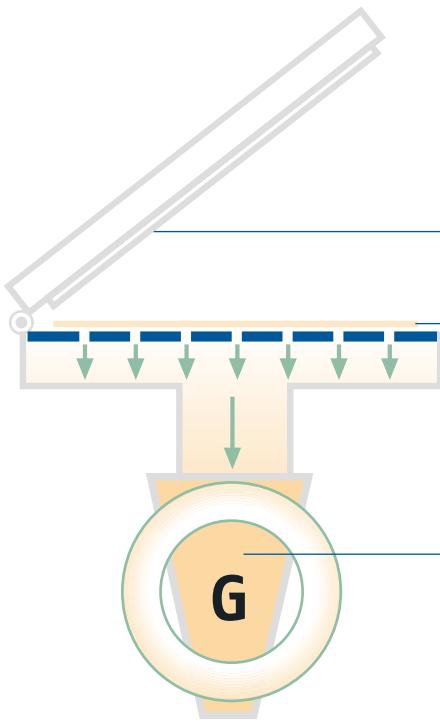

## Air cushioning for air tables

Ball valves used in air tables follow the same principle of design as those used for paper cutting machines.

As a result most manufacturers of paper cutting machines also offer air tables.

Air table equipped with a gas ring compressor

## Vacuum generation for screen printing machines

Blowers used in a suction table generate a vacuum which secures the paper sheets during the printing process to prevent slipping.

pressure plate

paper

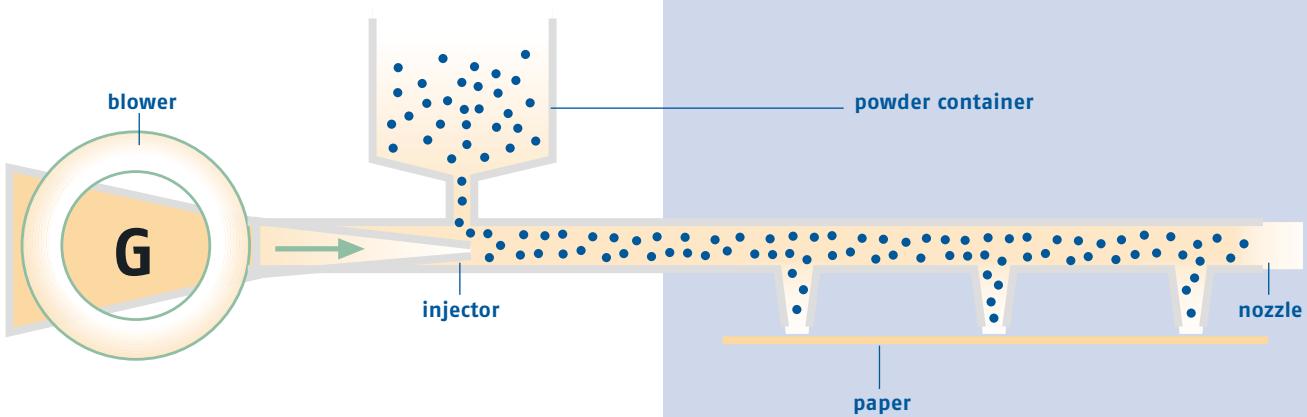

suction table

blower

Suction table for screen printing

## Powder spraying for printing machines (Dry and pressure spraying)

Powder is sprayed on the paper immediately after printing to avoid smearing of wet colour and sticking of paper to the machine. For spraying an injector is used.

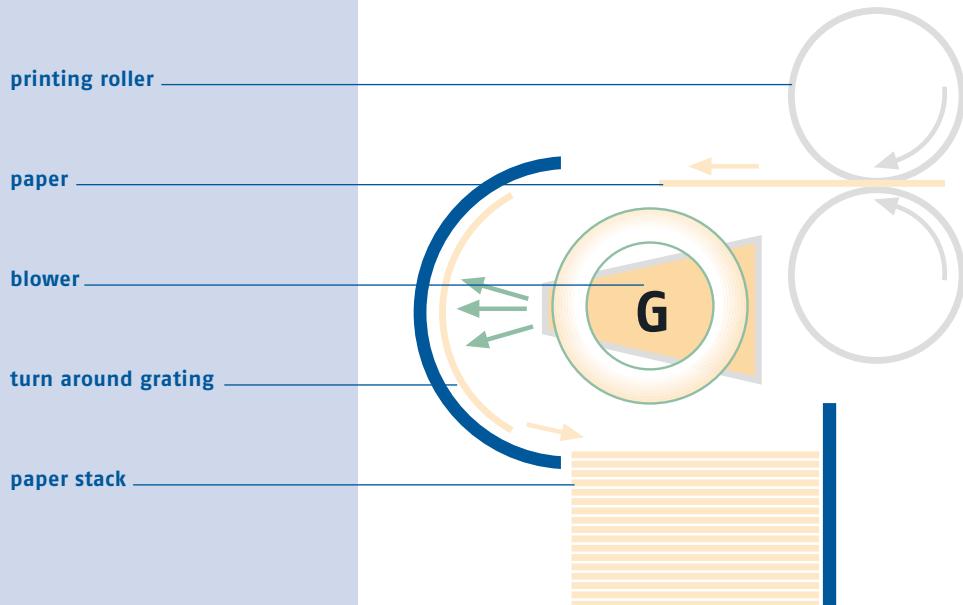

Powder spraying for printing machines

# G\_Series Application examples

## Air arm for printing machines

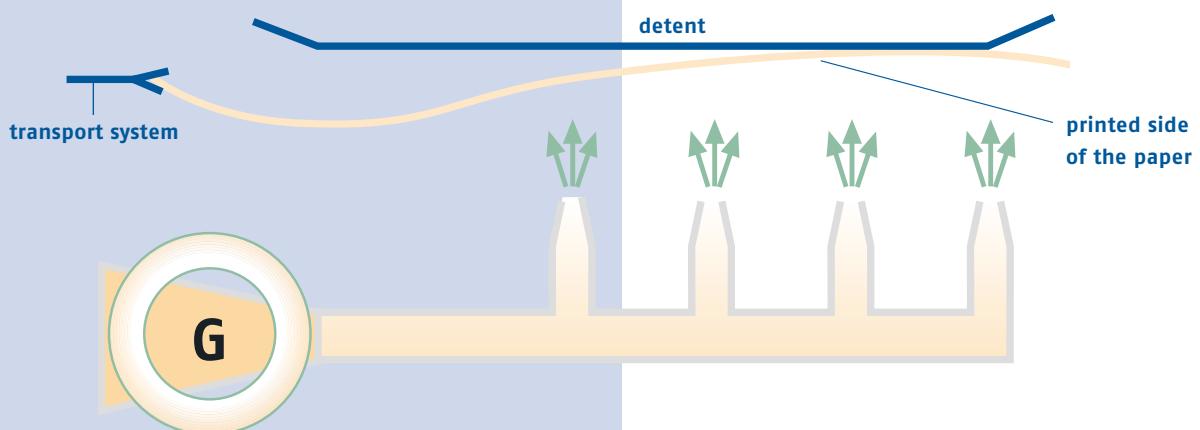

After passing the printing machine the sheets of paper are turned over and piled up. Both operations are supported by blast air.

Turning over paper by blast air

## Paper transport by air cushions

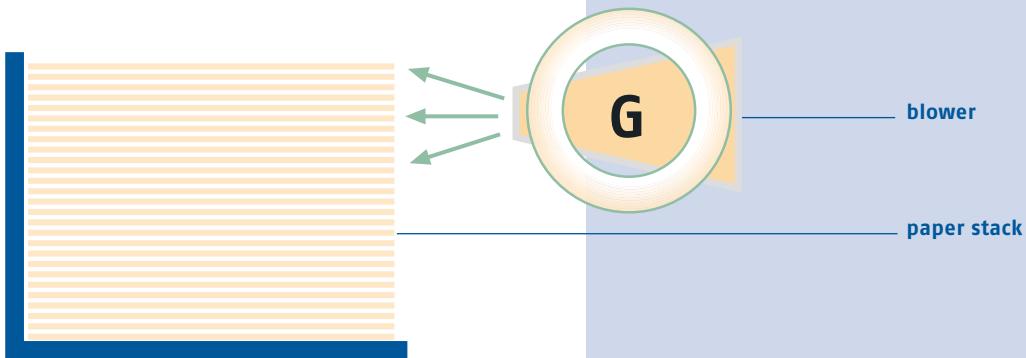

To avoid smearing of wet paint the sheets of paper are blown against a detent with the printed on side facing down.

Blast air transportation of printed paper

## Aeration of paper piles by blast air

Piled sheets of paper often tend to stick together especially when their surface is very smooth. Blast air can be used for separation by forming air cushions between the sheets.

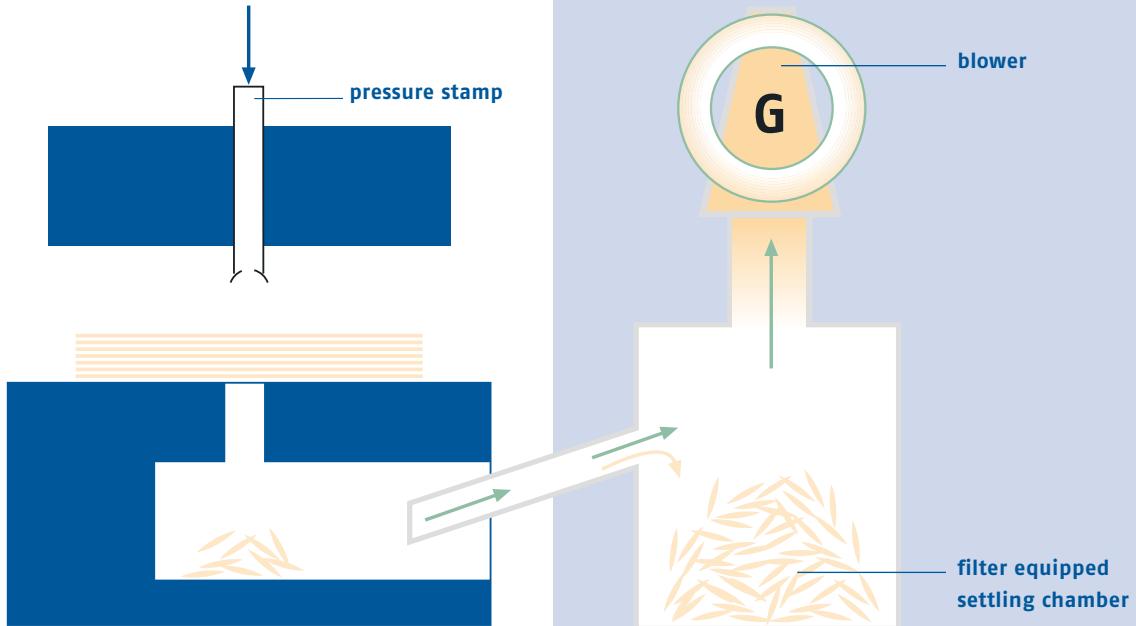

Loosening stacked paper by blast air

## Suction of paper clippings

(e.g. perforating machines, paper cutting machines, punched-card machines, Hollerith machines etc.)

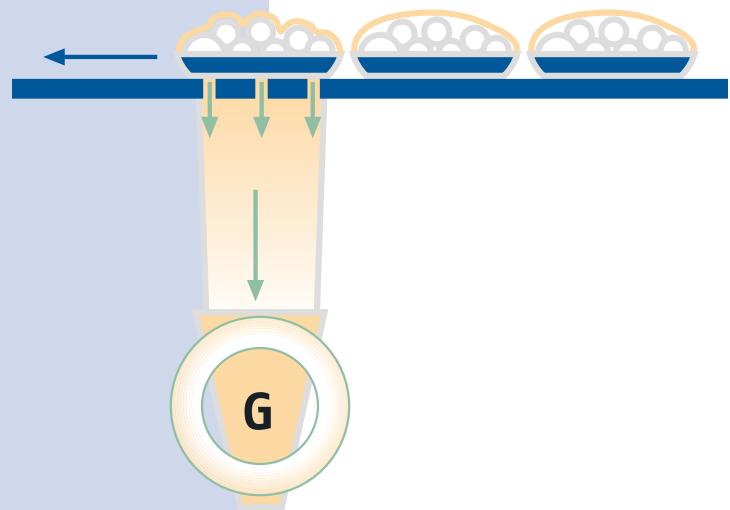

The paper clippings can be collected in a filter equipped settling chamber after being sucked off right at their origin.

Sucking in paper clippings at a vacuum table

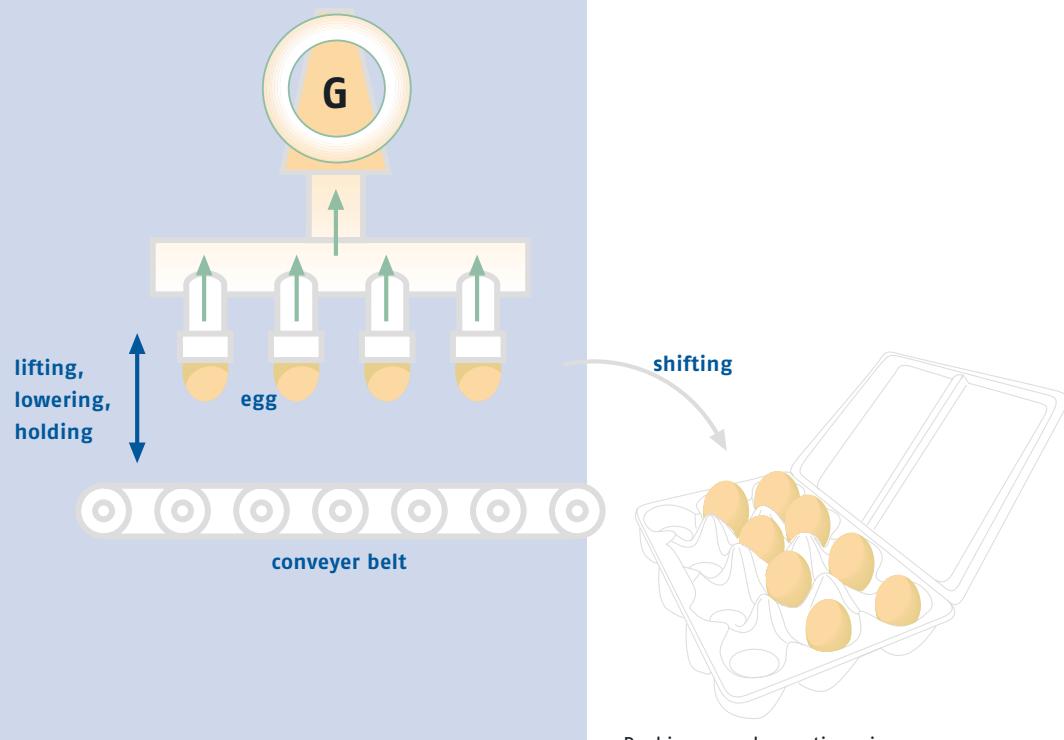

# G\_Series Application examples

## Evacuation of fruit packings

Evacuation of fruit packings

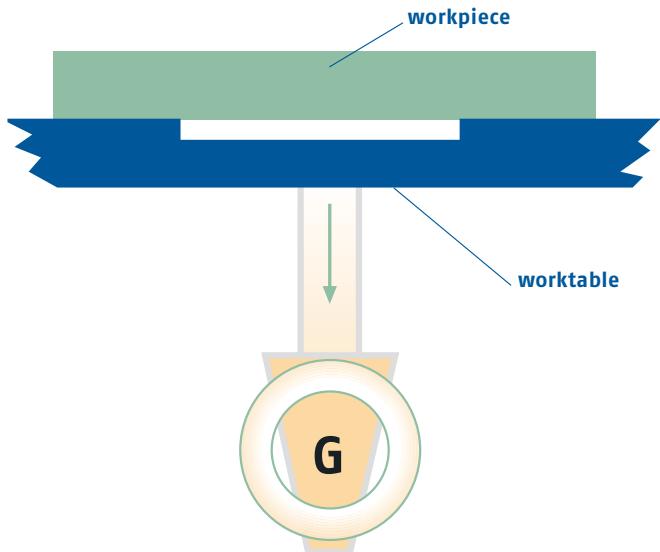

## Packing eggs by suction air

Packing eggs by suction air

## Holding and clamping of workpieces

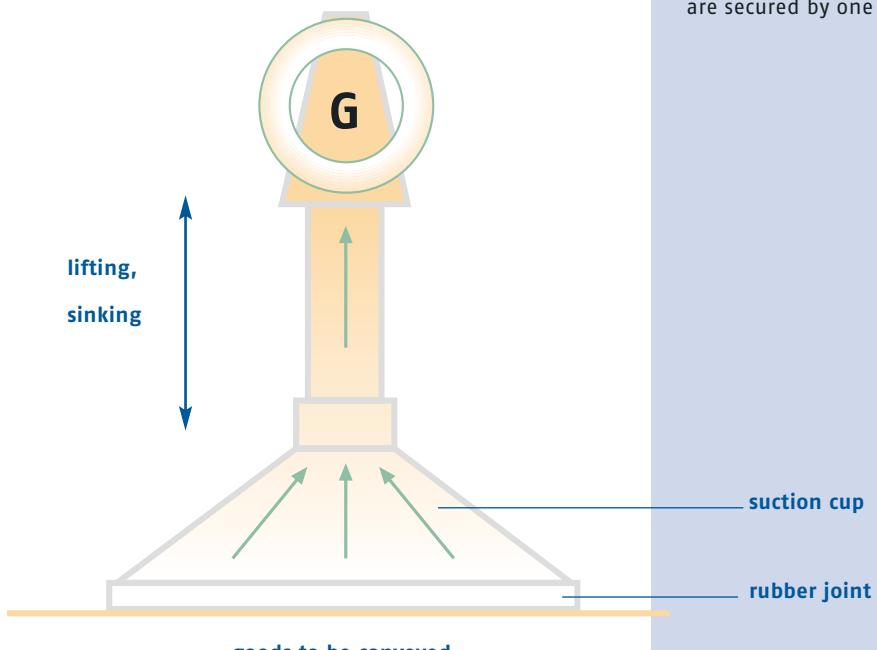

Suction air generated by a gas ring blower is used to secure the workpiece during machining. This way of clamping is especially important for parts that can't be secured by magnetic forces (e.g. workpieces consisting of wood, plastics, ceramics and non-ferrous metals).

Clamping workpieces by suction air

## Conveying machinery

Depending on their weight and size, the goods to be conveyed are secured by one or several suction cups.

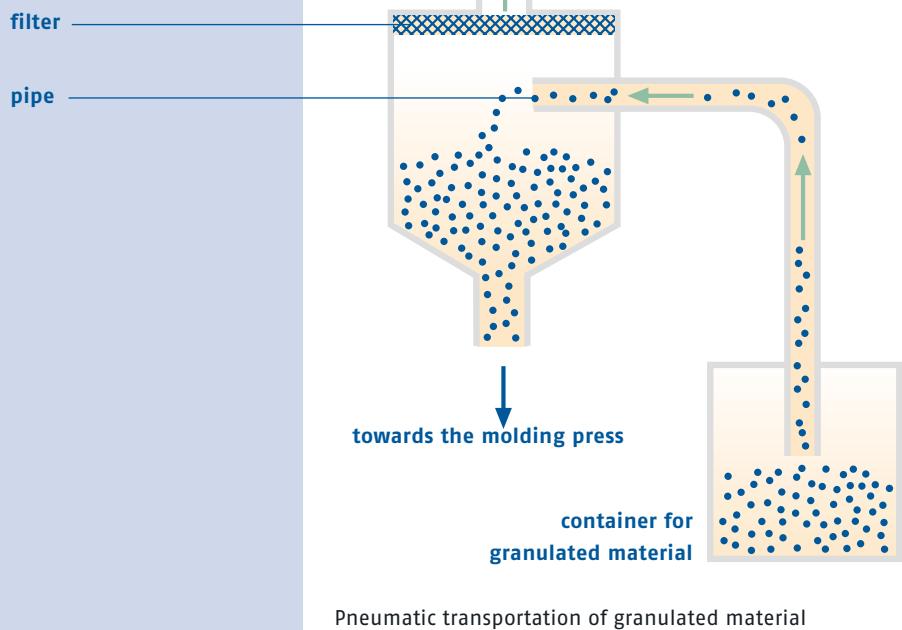

Lifting and transporting by suction air

# G\_Series Application examples

## Granulated material conveyers

Automated loading of molding presses and extruders. A blower generates a vacuum in the container for granulated material which is transported by the air flow. The gas ring blower is protected by a filter.

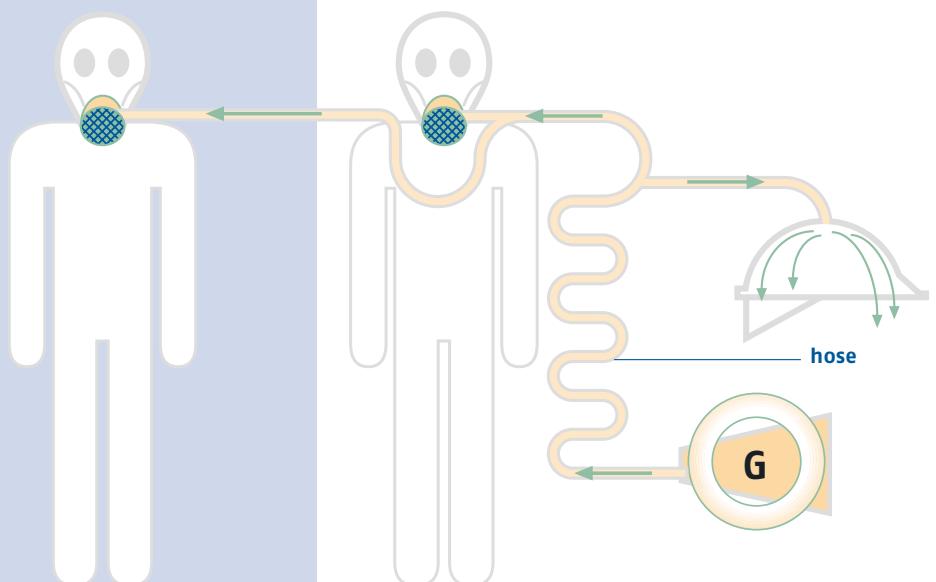

## Respirators

Fresh air is needed for breathing while working in polluted atmospheres. This is for example necessary in the chemical industry where big tanks, chambers etc. have to be cleaned.

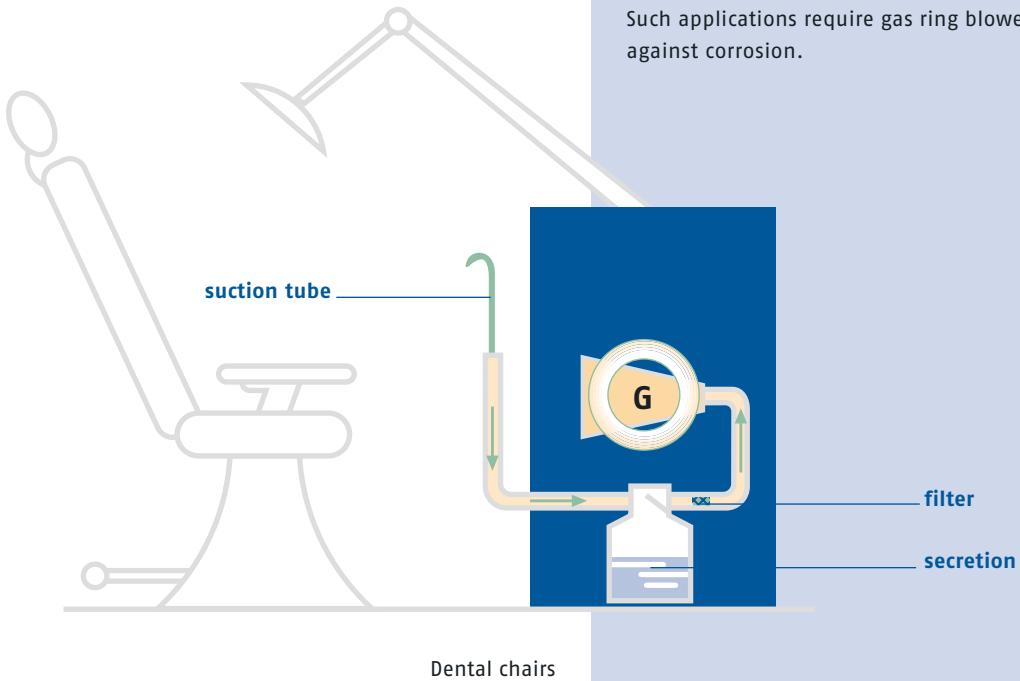

Gas ring blowers can provide fresh air for one or several respirators at the same time. A hose diameter of 1" and a maximal hose length of 15 ft are required.

Another possibility is to pump fresh air into the protective helmet from above so that no pollutants are inhaled by the worker.

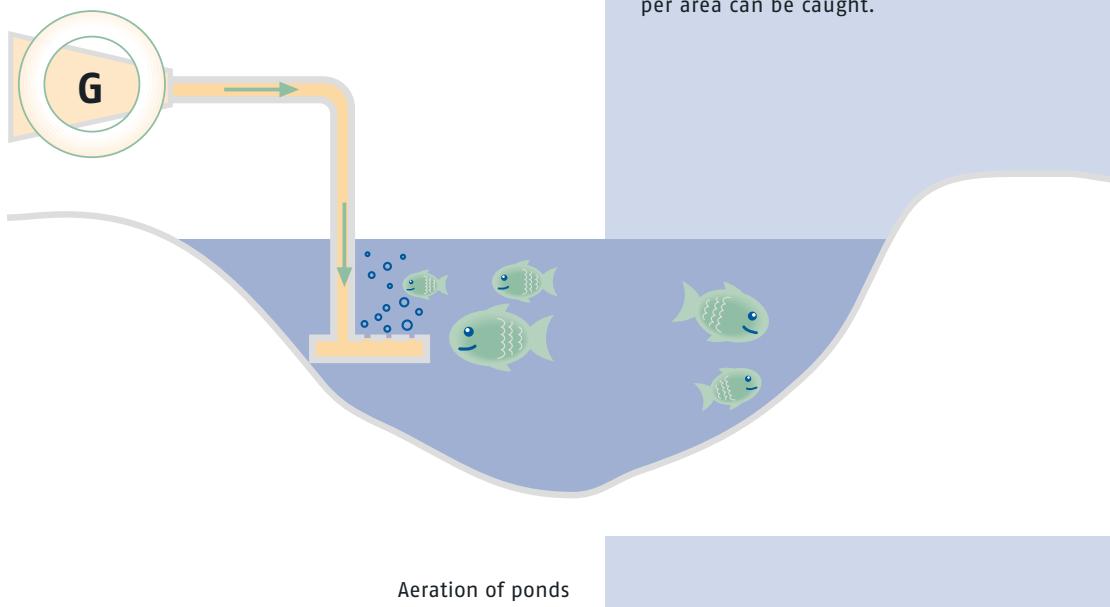

## Using suction air for dental appliances

In dental equipment vacuum air is used to empty the basin and to suck in cooling water from the drill as well as saliva and blood. Such applications require gas ring blowers that are protected against corrosion.

## Aeration of ponds

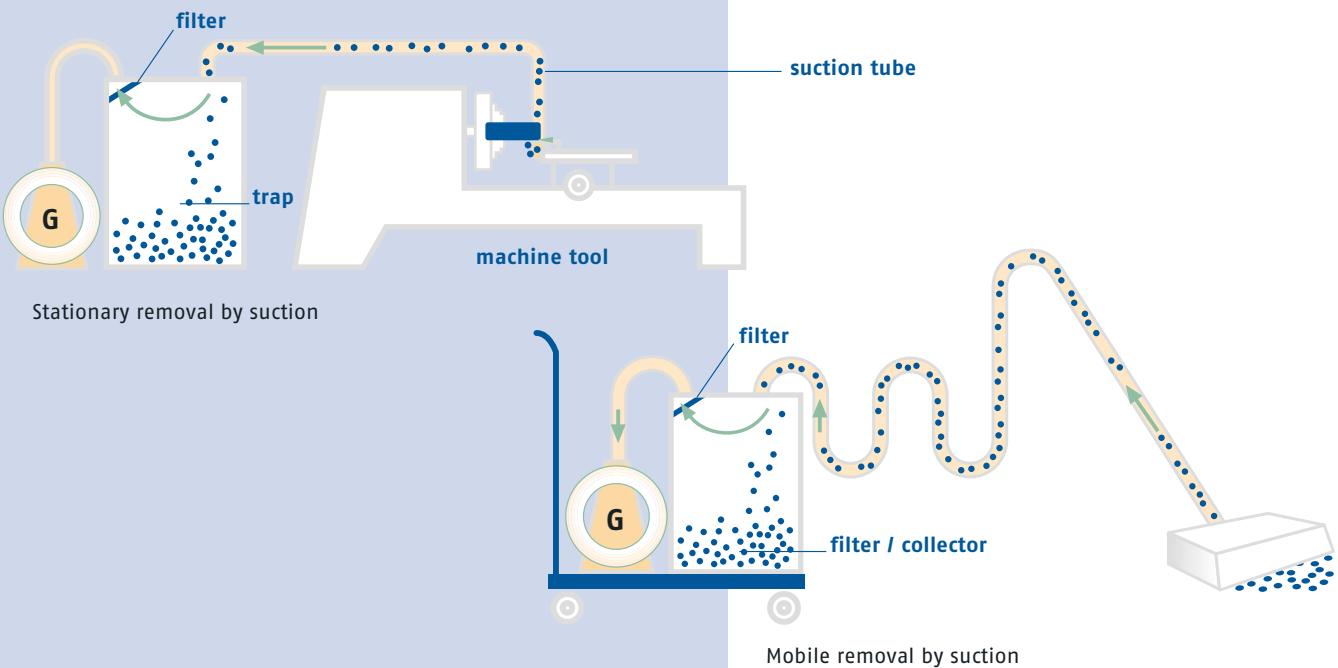

Pumping air into fish-hatching tanks can improve living conditions for the animals. This speeds up breeding so that more fish per area can be caught.

# G\_Series Application examples

## Dust exhaustion

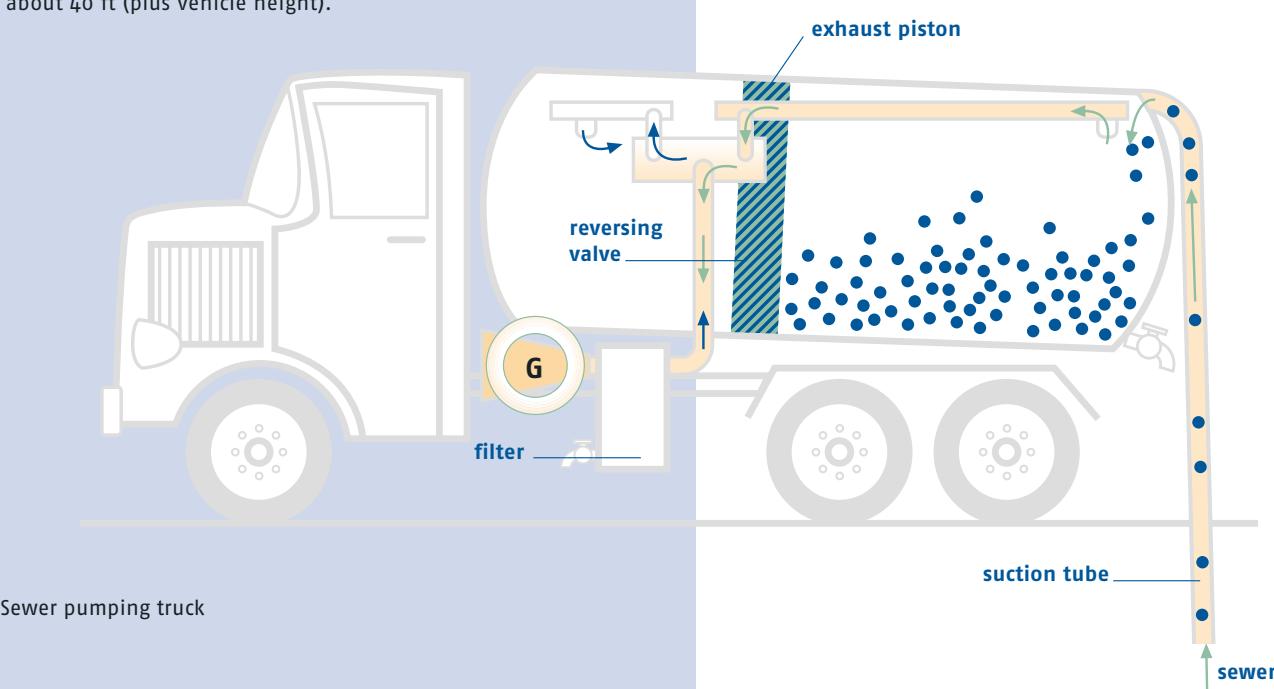

Waste from industrial production processes often consists of fine-grained dust which is injurious to health. Therefore it must be collected and disposed of by either stationary or mobile devices.

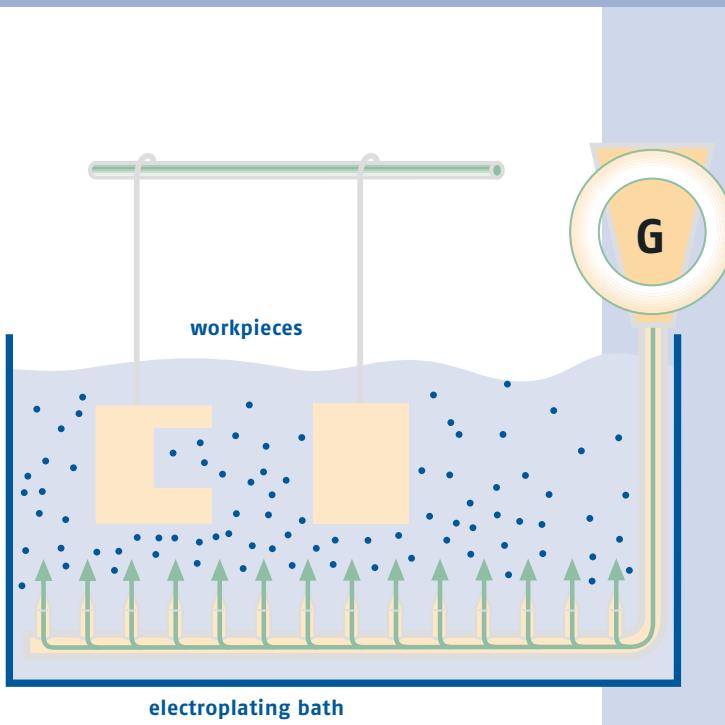

## Cleaning sewers by suction

Suction trucks are widely used in the municipal sector for cleaning sewers. Gas ring blowers generate a vacuum which is used for sucking in soil or residue from sewers at a free air capacity of about 40 ft (plus vehicle height).

— inward pumping  
— exhausting

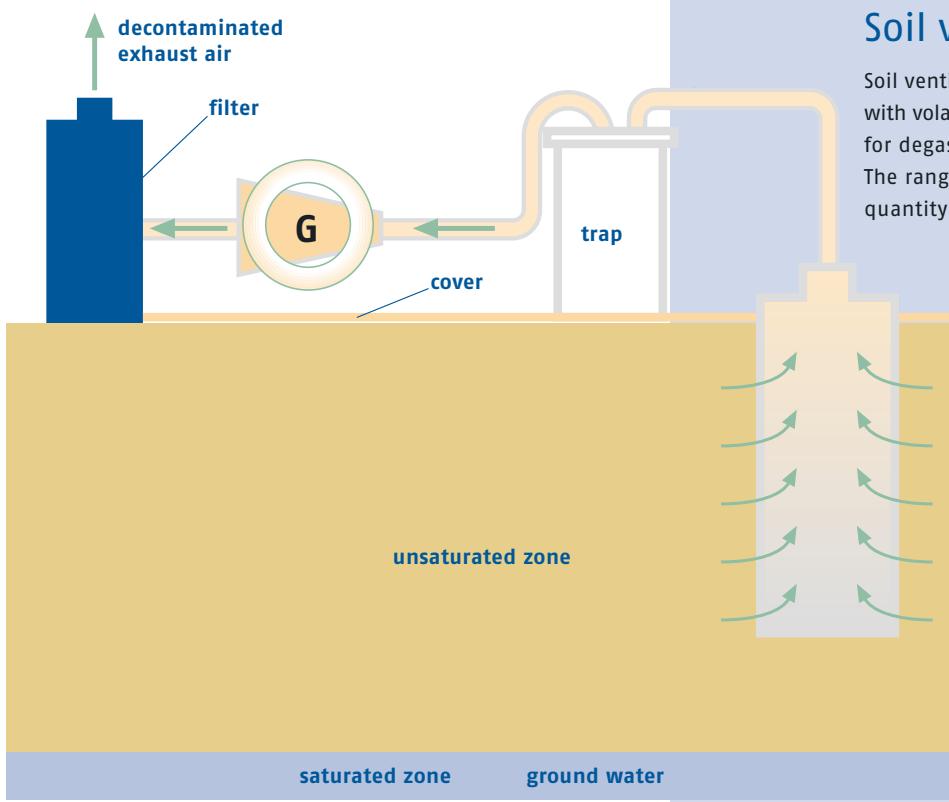

Sewer pumping truck

## Aeration of electroplating baths

Air is blown through a perforated pipe into the electroplating bath to improve intermixture. In addition that air bubbles are kept off the workpiece's surface.

## Soil ventilation devices

Soil ventilation is used for soils that are unsaturated with volatile substances. This method is recommended for degassing BTX and LHKW contaminated soils. The range of degassing apparatus depends on the quantity, dissemination and saturation pressure of the pollutant as well as on the air flow in the subsoil.

Depending on conditions mentioned above the range may vary between 33 and 262 ft. Exhaust air must be disposed of according to pollution control regulations (filtering, flaring etc.).

## Types of pressure

### Absolute pressure

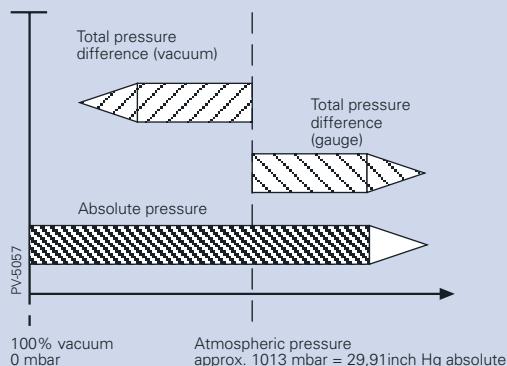

The pressure measured from absolute zero, using ideal vacuum as the datum. The measured pressure is always greater than the reference pressure.

### Total pressure difference, pressure

The pressure measured above the prevailing atmospheric pressure. The datum is the prevailing atmospheric pressure and the measured pressure is always higher than the datum.

### Total pressure difference, vacuum

The pressure measured lower than the prevailing atmospheric pressure. The datum is the prevailing atmospheric pressure and the measured pressure is always lower than the datum.

## Mass

Beginning units	Multiply by	to get	back conversion

cm	0.033	feet	30.48

## Temperature conversion

Conversion from	to	
°F	°C	$t[°C] = \frac{t[°F] - 32}{1.8}$
°C	°F	$t[°F] = 1.8 \cdot t[°C] + 32$

## Physical basics for blower applications

### Physical laws

Variable	Volume	Pressure	Power
Speed change	$\dot{V}_2 = \dot{V}_1 \left( \frac{n_2}{n_1} \right)$	$p_2 = p_1 \left( \frac{n_2}{n_1} \right)^2$	$P_2 = P_1 \left( \frac{n_2}{n_1} \right)^3$
Temperature change		$p_2 = p_1 \frac{ta_1}{ta_2}$	
Density change		$\rho_2 = \rho_1 \left( \frac{p_2}{p_1} \right)$	$P_2 = P_1 \left( \frac{p_2}{p_1} \right)$

### Index:

- 1 original (standard)
- 2 new

#### ■ Symbols:

$\dot{V}$	Flow	[cfm]
$n$	Drive speed	[rpm]
$p$	Pressure	[in Hg] or [PSI]
$P$	Power	[hp]
$\rho$	Density	[lbs/cu.ft.]
$ta$	Temperature absolute	[°F] (standard: 68 + 460 = 528 °F)

## Examples

#### ■ 1. Flow dependent on speed

A blower is operating at 3600 rpm and delivering 2000 cfm. If the speed is reduced to 3000 rpm, what is the new flow?

$$\dot{V}_2 = \dot{V}_1 \left( \frac{n_2}{n_1} \right) = 2000 \times \frac{3000}{3600} \approx 1667 \text{ cfm}$$

#### ■ 2. Pressure dependent on altitude

A blower is operating at an elevation of 5000 ft and is to deliver 3 PSI pressure. What pressure blower is required by standard conditions?

$$p_2 = 3 \times \frac{29.92}{24.89} \approx 3.6 \text{ PSI}$$

29.92 in Hg barometric pressure sea level

24.89 in Hg barometric pressure at a 5000 feet-level

When a blower is to operate at a high altitude it is frequently specified that the blower be capable of handling a given flow of standard conditions. It is then necessary to determine the equivalent flow of air at the higher altitude.

#### ■ 3. A blower is to operate at 5000 ft altitude and is to handle 2000 cfm of standard air. What is the flow of air the blower must handle at 5000 ft altitude?

$$\dot{V}_2 = \dot{V}_1 \frac{29.92}{24.89} = 2000 \times \frac{29.92}{24.89} \approx 2404 \text{ cfm}$$

# Annex

## ■ 4. Pressure dependent on the speed ratio

A blower is operating at a speed of 3600 rpm and delivering air at 3 PSI pressure. If the speed is reduced to 3000 rpm, what is the new pressure?

$$p_2 = p_1 \left( \frac{n_2}{n_1} \right)^2 = 3 \times \left( \frac{3000}{3600} \right)^2 = 3 \times 0.83^2 \approx 2.08 \text{ PSI}$$

## ■ 5. Pressure dependent on the temperature

A blower is to handle 200 °F air at 3 PSI pressure. What pressure (standard) blower is required?

$$p_2 = p_1 \times \frac{ta_2}{ta_1} = 3 \times \frac{660}{528} = 3.75 \text{ PSI}$$

A blower is capable of delivering 3PSI pressure with standard air.

What pressure will develop handling 200 °F inlet air?

$$p_1 = p_2 \times \frac{ta_1}{ta_2} = 3 \times \frac{528}{660} = 2.4 \text{ PSI}$$

## ■ 6. Power dependent of speed ratio

A blower is operating at a speed of 3600 rpm and requiring 10 hp. If the speed is reduced to 3000 rpm, what is the new required power?

$$P_2 = P_1 \left( \frac{n_2}{n_1} \right)^3 = 10 \times \left( \frac{3000}{3600} \right)^3 = 10 \times 0.83^3 \approx 5.78 \text{ hp}$$

### Table for barometric pressure of various altitudes

The pressure values generated with the following formulae:

$$p' [\text{in Hg}] = p_0 - 29.92 [\text{in Hg}] \left( 1 - \left( \frac{288[\text{K}] - 0.00198[\text{K}/\text{ft}] \times h[\text{ft}]}{288 \text{ K}} \right)^{5.255} \right)$$

$$p' [\text{hPa}] = p_0 - 1013.3 [\text{hPa}] \left( 1 - \left( \frac{288[\text{K}] - 0.0065[\text{K}/\text{m}] \times h[\text{m}]}{288 \text{ K}} \right)^{5.255} \right)$$

with  $p_0$  = pressure at your location.

In the table is  $p_0$  the standard air pressure 29.92 in Hg or 1,013 mbar and feet = 0 the sea level.

Formulae in accordance to CINA (Comité International de Navigation Aérienne)

# General safety information

## NOTE:

The products in this catalogue are used in the

- capital goods industry
- consumer goods industry
- and in such sectors as
- agriculture
- the building industry and
- allied trades.

This equipment has bare parts that are dangerous because they are live during operation; in some cases these are moving or rotating parts. Such parts could cause severe injury to persons and severe damage to property, for example in the event of unauthorised removal of protective covers, improper use, wrong operation or insufficient maintenance.

The people in charge of safety must therefore guarantee that:

- only qualified personnel are allowed to work on or around this equipment;
- these persons have access at all times to the operating instructions supplied and all other elements of the product documentation when working with the equipment, and are obliged to systematically follow the instructions given therein;
- unqualified personnel are not allowed to work on these machines or equipment or in the vicinity thereof.

## Qualified personnel

are persons who – on account of their training, experience, instruction, knowledge of the appropriate standards, specifications, accident prevention regulations and the operating environment – have been authorised by those responsible for plant safety to perform the necessary work and at the same time to recognise and circumvent potential hazards.

Knowledge of first aid and familiarity with the pertinent life-saving equipment are also necessary.

The barring of unqualified personnel from work on heavy-current equipment is regulated by DIN VDE 0105 or IEC 364.

For the sake of clarity, the operating instructions supplied with the equipment cannot contain all the detailed information on possible design variants and in particular cannot take into account every conceivable type of installation, operation or maintenance.

The operating instructions therefore basically contain only the information necessary to enable qualified personnel (see above) to operate the machines or equipment correctly in industrial applications.

In the event that the machines or equipment are intended for service outside of industry, where more exacting demands may be placed on them (such as touch protection for children), the installation work must be supplemented by further protective measures that are to be implemented locally.

Where clarifications are necessary, particularly with respect to lack of product-specific detailed information, please contact the sales office concerned, quoting the type designation and manufacturing number of the machine or equipment.

**It is advisable to arrange for our service centres to take charge of the necessary planning, installation, commissioning and after-sales service.**

# General delivery conditions

## Export regulations

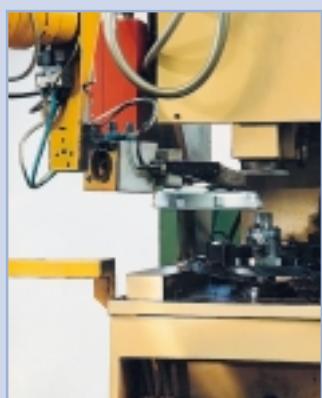

According to the current provisions (01/2003) of the German and US export regulations, the products listed in this catalogue do not require any export permit. Export or re-export is therefore allowed without the permission of the competent authorities unless the Order on Foreign Trade lays down country-specific restrictions. This is subject to change. The markings given on the delivery slip and invoice are the decisive criteria. An export permit obligation may arise for specific countries as a result of the intended use of the products.

Unless otherwise stated on the individual pages of this catalogue, we reserve the right to make changes, especially to the given values, dimensions and weights.

Illustrations are not binding. Our General Conditions of Trade and Delivery apply.

Electronic check of the dimensional accuracy of a G\_Series impeller.

## Trade marks

All product designations are trade marks or product names of nash\_elmo Industries or other companies.

## Responsible for the technical content

Dipl.-Ing. Lutz Kasimir  
nash\_elmo Industries GmbH  
Corporate Communication

Fully automatic final check of endshields of F\_Series and G\_Series drives.

# Only quality has a future

Technical progress and market success are inseparable from the high quality of nash\_elmo products. To guarantee this high quality level, a reliable quality assurance system has been established for monitoring all phases of production from development to delivery.

This quality assurance system meets the worldwide requirements, complies with the relevant standards and specifications and fulfills the requirements of ISO 9001:2000.

This gives our customers the following advantages:

- maximum operational safety;
  - high, consistent supply reliability;
  - compliance with the requirements of the European Market;
  - participation in national and international tenders.

Check of performance data and printing of the test protocol.

## ATEX information

Since July 1, 2003, it is compulsory by law within the European Union to design explosion-proof machines according to ATEX 94/9 EG.

Free trade within the EC for ATEX compliant machines and devices are therefore guaranteed due to European standardization of machine requirements. ATEX also includes non-electric devices that are a potential ignition source.

A subdivision "Gas/particle(dust) explosion protection" according to ATEX results through the marking G (as)/D (ust). The „zones“ (according to RL 1999/92/EG) represent work areas in which an explosive atmosphere<sup>1)</sup> can occur.

Depending upon the frequency and the duration of the appearance of the explosive atmosphere, ATEX subdivides different zones in which corresponding categories are assigned.

„Continuously or for longer periods of time“

Zone 0 (=G) und 20 (=D) Devices of category 1

„Occur occasionally“

Zone 1 (=G) und 21 (=D) Devices of category (1 or) 2

„Normally not likely to occur, or only for short periods of time“

Zone 2 (=G) und 22 (=D) Devices of category (1, 2 or) 3

Our G\_200 and G\_400 ranges of gas ring compressors are produced according to the ATEX requirements. Machines in the EEx version have been discontinued and replaced by machines corresponding to the new directive, category 3.

There is an ATEX version of every housing size of the G\_200 range available in category 3D, 3G, 3/2D and 3/2G<sup>2)</sup>. The side channel blowers comply with the temperature class T3 with a max. (surface) temperature of 125°C and correspond to the protection class IP55. For the category 3/2D, the blowers correspond to the protection class IP65..

All ATEX machines of the G\_200 series are available for the categories 3D, 3G and 3/2D as fixed voltage machines for 50 and 60 Hz. For the category 3/2G, only a pure 50-Hz version is available.

1) Mixture of air (oxygen) and flammable gases, steam, powder.

2) 3/2 means: Category 3 inside, Category 2 outside

# G\_Series Voltage Overview

Voltages at 50 Hz <sup>4)</sup>		
2BH1 ...-...□.□		
<b>3-phase</b>		
185-225 V $\Delta$ / 320-390 V Y	H 1	CUL US
200-240 V $\Delta$ / 345-415 V Y	H 6	CUL US
345-415 V $\Delta$	H 7	CUL US
500 V $\Delta$	C 5	CUL US
<b>1-phase</b>		
100/200 V	V 4	CUL US
115/230 V	V 5	CUL US
230 V	A 1	
Voltages at 60 Hz <sup>4)</sup>		
<b>3-phase</b>		
200-240 V $\Delta$ / 345-415 V Y	H 1	CUL US
220-275 V $\Delta$ / 380-480 V Y	H 6	CUL US
380-480 V $\Delta$	H 7	CUL US
575 V $\Delta$	C 5	CUL US
<b>1-phase</b>		
100/200 V	V 4	CUL US
115/230 V	V 5	CUL US
115 V	B 6	
230 V	B 8	
Voltages 3-phase ATEX <sup>4)</sup>		
<b>50 Hz, categories 3D, 3G, 3/2D</b>		
230 V $\Delta$ / 400 V Y	D 1	
500 V $\Delta$	D 5	
400 V $\Delta$ / 690 V Y	D 6	
<b>50 Hz, category 3/2G</b>		
230 V $\Delta$ / 400 V Y	D 1	
500 V $\Delta$	D 5	
400 V $\Delta$ / 690 V Y	D 6	
<b>60 Hz, categories 3D, 3G, 3/2D</b>		
460 V $\Delta$	D 1	
575 V $\Delta$	D 5	
460 V Y	D 6	
<b>60 Hz, category 3/2G</b>		
440 V Y	G 1	
575 V $\Delta$	G 5	
440 V $\Delta$	G 6	

Specification of voltage  
in order number:

Other voltages available  
upon request

## Footnotes:

- 1) Measuring surface sound-pressure level acc. to EN 216801, measured at a distance of 1 m. The pump is throttled to a medium inlet pressure, a hose is connected to the discharge side, and a vacuum-relief valve is not fitted.
- 2) For selection and ordering information, see accessories. The pressure limits of the valves are based on a cooling agent and ambient temperature of 25 °C.
- 3) For 2BH1 943, only mounting on the end-casing is possible.
- 4) Tolerances: the motors comply with DIN EN 60 034/DIN IEC 34-1 and Insulation Class F:

### Three-phase:

fixed voltages incl. ATEX       $\pm 10\%$   
 voltage range       $\pm 5\%$   
 in compliance with UL and CSA - 10 % / + 6 %  
 (UL 507 u. CSA 22.2 No. 113)

### Single-phase:

Fixed voltages:       $\pm 5\%$   
 If during continuous operation only 90% of the maximum end pressure is used, the admissible tolerance increases to       $\pm 10\%$ .  
 In compliance with UL and CSA - 10 % / + 6 %  
 (UL 507 u. CSA 22.2 No. 113)

### Frequency:

The motors comply with the IEC and European norms quoted. The European norms replace the national norms of the following member states: Germany (VDE), France (NF C), Belgium (NBNC), Great Britain (BS), Italy (CEI), Netherlands (NEN), Sweden (SS), Switzerland (SEV) and others.

The machines also comply with various national norms.

The following norms have been adapted to the publications IEC 60 034-1 and the motors can be used at standard rated performance:

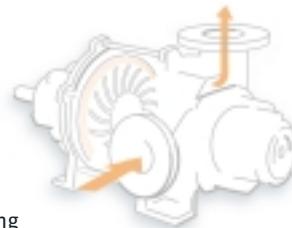

UL 507	USA
CSA 22.2, No. 113	Canada
IS 325	India
IS 4722	
NEK_IEC 60034-1	Norway

## Our product range

### L\_Series Liquid ring vacuum pumps and compressors

- Chemical and petrochemical industry
- Process engineering
- Paper and pulp industry
- Power plants
- Plastics industry
- Medical technology
- Food industry
- General mechanical engineering

### D\_Series Dry pumps

- Chemical and pharmaceutical industry
- Process engineering
- Metallurgy
- Packaging industry
- Food industry

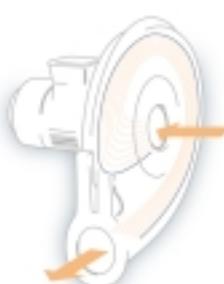

### V\_Series Vane pumps

- Chemical and petrochemical industry
- Food processing industry
- Packaging
- General mechanical engineering

### F\_Series Radial Fans

- Plastics industry
- Printing industry
- Glass industry
- Industrial furnaces
- Industrial vacuums

### S\_Series Standardized systems

- Chemical industry
- Process industry
- Food processing industry
- Packaging
- Power generation and supply

correction level: A2a/2005
